PYTHON / WORKFLOW AUTOMATION

LeadFlow

Lead intake, qualification, review and export | Functional local demo

PROJECT SNAPSHOT

LeadFlow demonstrates a review-first pipeline for incoming business enquiries. It validates information, applies transparent qualification rules, prevents duplicate email-based records, and prepares follow-up drafts without sending messages.

01 Intake > 02 Validate > 03 Score > 04 Deduplicate > 05 Review > 06 Export

IMPLEMENTED CAPABILITIES

- **Structured intake**
  JSON lead records with input checks and missing-budget handling.
- **Explainable scoring**
  Rule-based tiers with scores and reasons for review.
- **Duplicate control**
  SQLite record storage with normalized-email deduplication.
- **Approval workflow**
  Follow-up drafts remain unsent; an explicit approval action is available.
- **Data portability**
  CSV export for review or manual CRM import.

DEMO STATUS

Local working prototype with example data and automated tests. No live AI model, external CRM, email account, or production system is connected.

ENGINEERING NOTES

Built for review-first workflows

Clear boundaries and a practical path toward deployment

DEMONSTRATION OUTPUT

Example lead	Example Co (fictional sample)
Score / tier	100 / HIGH
Scoring reasons	Company, detailed requirements, budget, urgency
Human action	Review generated follow-up draft
Export	CSV summary for manual import

QUALITY AND SAFETY

- Includes tests for missing data, scoring, duplicates and approval state.
- Preserves unknown information instead of filling gaps with invented facts.
- Does not send follow-up messages or write to a live CRM.
- Uses fictional example data; no client results or production metrics are claimed.

EXTENSION ROADMAP

1. **Validated LLM output**
   Add schema validation and fallback to manual review.

2. **Form / CRM integration**
   Connect authorized systems through secure webhooks and APIs.

3. **Reliability controls**
   Add event idempotency, retries, monitoring and retention rules.
